COM/CSC 372 Final Project

Client Website

Overview

Throughout the semester, you have worked with a real client to design and develop a high-quality, usable, and accessible website based on their goals and needs. In this final project, you will refine and complete your client website by integrating all course concepts into a polished and production-ready application. You will also obtain final client approval, confirming that the website meets expectations and is ready for delivery.

This final project demonstrates your mastery of dynamic web design and programming through the completion of a fully developed client website that follows the full design and development process from beginning to end.

Part I: Setting Up Your Workspace

Since you have multiple versions of your client site in your GitHub repository, you will need to create a new branch that uses the version (PHP, Express/Handlebars, or React) that best aligns with your client's vision and goals.

Follow the steps below to set up your workspace for this assignment:

- ☐ Create and switch to a new branch called **client_site_final**. Refer back to Creating & Managing Git Branches (GitHub Desktop) **OR** Creating & Managing Git Branches (Git CLI) depending on which one you're using.
- ☐ Complete Open Your Web Project Subdirectory In Your IDE section to open the **client_site** folder in your IDE.
- ☐ Work inside your **client_site_final** branch as you make updates to your site. This branch will contain all of your updates for this assignment.
- ☐ Use the steps from previous assignments (PHP, Express/Handlebars, or React) to run and test your site on your local device as you make changes to it.
    - **Note:** This URL link is for testing purposes only on your local device! Do NOT include this link (i.e., **file:///Users/…** or **http://localhost:...**) in your submission for this assignment.

Part II: Minimum Requirements

Regardless of the version of your client site (PHP, Express/Handlebars, or React), your final project must demonstrate the following core concepts. These represent the essential skills developed throughout the semester. Your project will be evaluated based on how effectively these concepts are demonstrated in your final site and supporting documentation.

A. Frontend

Your client site should have a clear structure, cohesive styling, and meaningful interactivity that reflects your client's goals, supports your intended audience, and creates an effective user experience. At a minimum, your site must:

- Use clear and consistent navigation across all pages
- Organize content using a logical site structure
- Showcase your original logo on at least one page
- Include relevant content that fits the purpose of each page
- Demonstrate a unified look and feel through consistent design choices (colors, fonts, layout, branding)
- Include at least one meaningful interactive feature (e.g., gallery, filter/search, testimonials, collapsible sections)
- Be fully responsive across different screen sizes and devices
- Follow accessibility best practices (e.g., alt text, heading structure, readable contrast, keyboard navigation)

B. API Integration

Your client site should integrate a public API that adds meaningful functionality or data. At a minimum, your site must:

- Successfully connect to an API using fetch or an approved library
- Make at least one real API request
- Display API data in the user interface (not just console output)
- Handle asynchronous behavior using Promises or async/await
- Handle loading and error states appropriately
- Provide user feedback during loading (e.g., spinner, message, placeholder content)

C. Form Validation

Your client site should include a form that validates multiple user inputs. At a minimum, your site must:

- Include one form with multiple inputs
- Validate user input and display clear error messages
- Properly handle user input (e.g., sanitization)
- Display a success message or redirect upon successful submission

D. Application Structure

Your client site should demonstrate reusable structure using your selected technology. At a minimum, your site must:

- Use templating or reusable components
    - Express: layouts/views
    - PHP: includes
    - React: components
- Handle navigation appropriately (routing, query strings, or component-based navigation)
- Display dynamic content based on user interaction or navigation

E. Security & Performance

Your client site must demonstrate both security and performance considerations. At a minimum, your site must include:

- At least one security implementation (e.g., input validation, sanitization, prepared statements)
- At least one performance improvement (e.g., optimized assets, efficient data loading, reduced unnecessary rendering)

F. Technical Highlights (Project-Specific)

Your client site must include at least two meaningful and distinct technical features unique to your project or chosen technology. Examples may include cookies or sessions, database integration, React props/state, or custom logic or advanced features.

Each example must work successfully in your site and be clearly explained in your documentation.

G. Comments

Use comments in your code to document both your work and (if applicable) your AI usage:

- **At the top of your file:** Include your name, the date, and a short description of the component or file.
- **Within your code:** Add comments to explain major sections, describe important logic, and clarify any complex or non-obvious code.
- **If you used AI:** Add one or more comments with a clear flag (e.g., AI-assisted suggestion) that explain what the AI helped with and include a link to your detailed AI documentation.

H. Overall Site & Expected Result

Your client site must meet the following expectations:

- The site is fully deployed and accessible via a live URL
- The site loads correctly
- Navigation between pages works
- All routes display the correct content
- Layout is consistent across pages
- Styles are applied correctly and match (or improve upon) the design
- Images and assets display properly
- Interactive features function correctly
- Forms accept input and validate correctly
- Some content is rendered dynamically

Part III: Client Feedback & Approval

In your final consultation with your client, you will review peer feedback, present the current version of your website, and confirm that it meets your client's goals and expectations. This step represents the final stage of refinement before project completion and handoff.

A. Final Consultation

During your meeting, you should focus on both reviewing feedback and evaluating the current state of the site.

- **Peer Feedback Review:** Summarize the feedback received during the Web Expo. Identify patterns, common concerns, and recurring suggestions, and review these with your client.
- **Current Site Walkthrough:** Guide your client through the website's navigation, content, and features to evaluate whether the site meets their expectations.

Use the following questions to guide the discussion:

- Are users getting the information they need from the site?
- Is the site visually appealing and easy to use?
- Are there patterns or common themes in the feedback?
- What are the most important issues identified?
- How should these issues be prioritized (high, medium, low)?

Submit a summary of your discussion with the client that includes:

- Date and time of when the meeting took place.

  5/6/2026 at 12:25pm

- Whether the meeting was in person, via Zoom, phone call, or another platform.

  Meeting was over FaceTime

- Summary of key points discussed including:
  - Major themes or patterns in peer feedback

    Visuals looked great, peers said more dynamic navigation would be better.

  - Feedback the client agreed to address and how it will be implemented

Client agreed that the visuals looked great; exactly what they wanted. Client said navigation was fine and easy to use, but if a navigation bar needed to be added later on, it would be good.

- Feedback the client chose not to incorporate and why

  Client chose not to incorporate dynamic navigation with a navigation bar because they like the uniqueness of clicking on the ASA logo to navigate between pages.

- Additional feedback or concerns raised by the client

  - Fix the weird image sizing with certain images in the slider
  - ASA statement is outdated; when a new one is created, they prefer to use that one
  - Put ASA statement on homepage too so that users can see the statement first, and also see it in the 'About' page with all the eBoard members
  - Add PGA stuff later on

- A list of final changes or refinements to be made.

  - Fixing the image sizing with the image slider and putting the ASA statement on the homepage as well.

B. Final Revisions & Approval

After your consultation, implement the final set of revisions agreed upon with your client. Once all updates are complete, obtain formal approval before turning over the project.

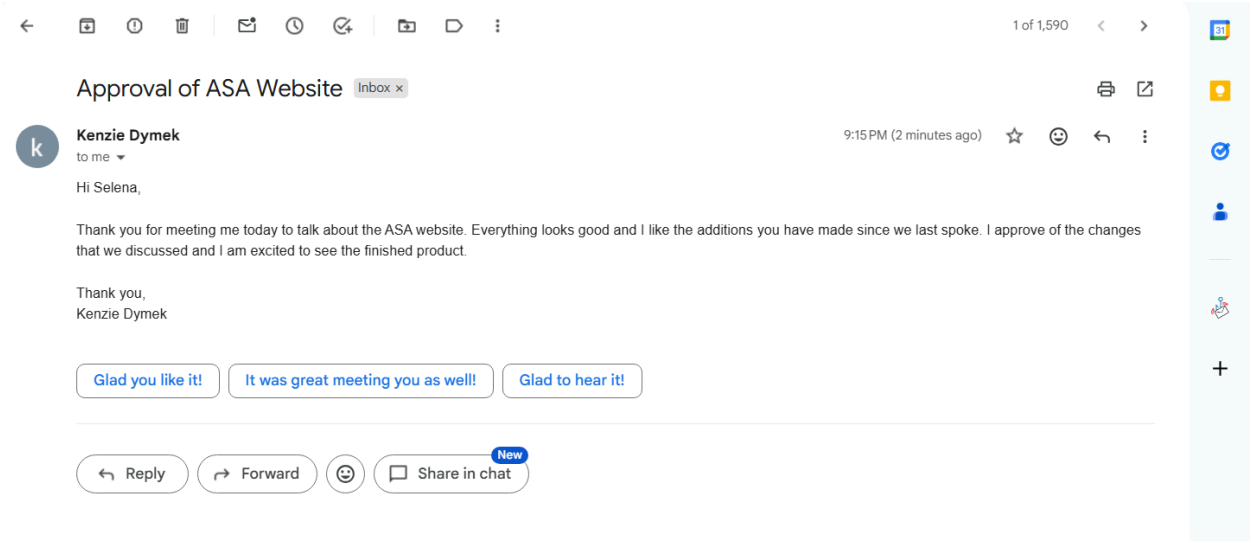
Acceptable forms of approval include:

- A signed document from your client explicitly stating they have reviewed and approved.
- An email or written message from your client explicitly stating they have reviewed and approved.
- A screenshot or recording of a written or verbal acknowledgment during your meeting. If recorded, ensure your client consents to being recorded.

This approval marks the completion of your development process and the official handoff of the website.

Screenshot below of the FaceTime call. I know we look chopped, so please disregard.

Email proof since my screen recorded audio on our FT did not work:



C. Project Summary & Handoff

Create a clear and professional project summary written in plain language your client can easily understand. Avoid technical jargon and focus on communicating value.

Your project summary should:

- Briefly explain how the website works and summarize the work you completed. Focus on the site's features and functionality in a way your client can easily grasp.
- Highlight the value you brought to the project (e.g., improved user experience, custom features, performance).
- Provide a basic maintenance plan for your client. This may include:
    - Descriptions of key features and how they work
    - Links to helpful tutorials or resources
    - Notes on finding and understanding your code comments
- Share key lessons you learned during development.
- Suggest future improvements or additional features to enhance the site.

D. Final Delivery

You must provide your client with:

- The project summary
- The URL of the live website

This completes the official handoff and allows your client to continue using the site.

⚠️ **Important Note:** You may share your project files with your client, but **do NOT share your cPanel login credentials or MySQL database access**. These accounts were created for academic use only and will be removed at the end of the semester.

If your client plans to continue using the site, ensure they have a copy of the necessary files before hosting services are discontinued.

Submission

When you're finished, complete the following steps to submit your work:

- [x] ~~Include a copy of your **feedback review**, **client approval** and **project summary** **inside** your **documentation** folder. Be sure each file is clearly named (i.e., **final_feedback.pdf**, **final_client_approval.pdf**, **final_project_summary.pdf**).~~

- [x] ~~Include the URL to the **client_site_final** branch of your GitHub repository. This branch should contain all final updates to your client site.~~

- [x] ~~Include the URL to your live website. Your live site should reflect the final version of your project and be fully functional. Refer to previous assignments for instructions on deploying your site based on your selected technology (PHP, Express/Handlebars, or React).~~

Paste the URLs in the provided textbox in Brightspace. Click the blue *Submit* button to successfully submit your work for this assignment.

Grading Rubric

You can refer to the **Final Project: Client Site grading rubric** given in Brightspace for this assignment to find details on how your submission will be graded.
